// warnings

\$ What it is

- > Reminds first-year students about upcoming assignment deadlines
- > Flask web app with a login page
- > SQLite database stores users and deadlines
- > A background worker checks the database every minute
- > The worker sends reminders by email

\$ How it came together

- > Sep 20: project setup, SQLite database, login page
- > Sep 22: reminder worker added; SMTP timeouts on campus wifi
- > Sep 24: retry queue for emails; “db locked” errors appear
- > Sep 27: WAL mode on; beta for my hostel floor
- > Sep 30: usage growing, dashboard built

5 / 11

\$ users.csv

\$ Problem 1: emails timing out

- > The worker sends reminders over SMTP every minute
- > On campus wifi, SMTP kept timing out
- > I moved emails onto a retry queue
- > After that the timeouts mostly went away

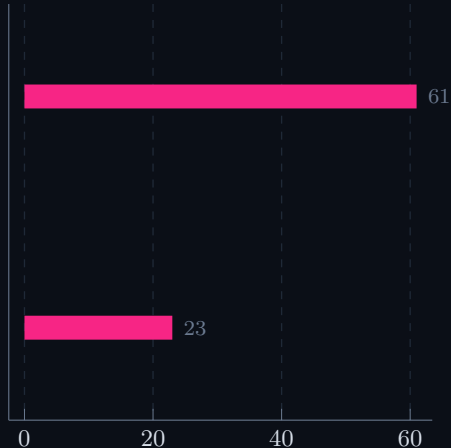

\$ Problem 2: “database is locked”

- > Worker and web app both wrote to SQLite
- > Writing at the same moment gave “db locked” errors
- > I turned on WAL mode in SQLite
- > The locked errors dropped a lot

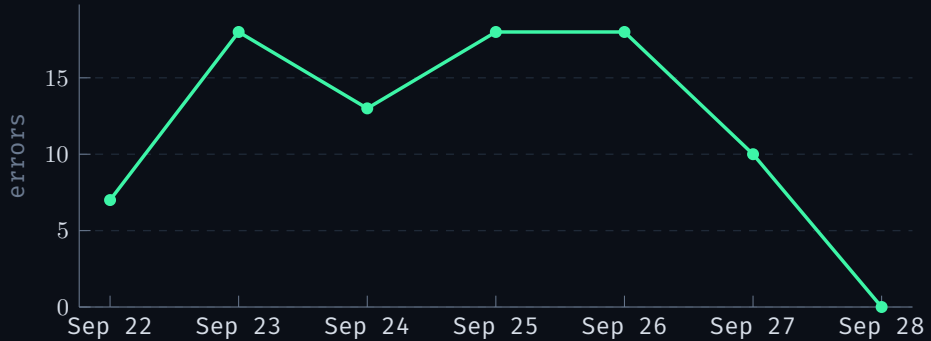

\$ Most frequent errors

`sqlite<n>.OperationalError: database is locked (job <n>)`

`smtp timeout after <n>s sending to user<n>@uni.edu`

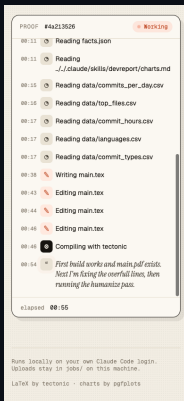

\$ Errors over time
